

dile-crud

The `dile-crud` component is the primary tool for building the CRUD system, combining various components from this library to implement the full functionality of a create, read, update, and delete (CRUD) system.

Additionally, `dile-crud` also offers batch operation management through the definition of action components.

Installation

```
npm i @dile/crud
```

Usage

Import the `dile-crud` component.

```
import '@dile/crud/components/crud/crud.js';
```

Use the component.

```
<dile-crud  
  .config=${this.config}  
></dile-crud>
```

Properties

- **title**: String, title for the crud component. Optional.
- **config**: Object, the configuration object that customizes the behavior and functionality of the CRUD system.
- **actionIds**: Array, the list of IDs for the items selected for batch operations.
- **keyword**: String, the search keyword used to filter the items in the CRUD system.
- **belongsTo**: String, indicates the name of the resource to which the records managed by the `dile-crud` component belong in this instance.
- **relationId**: String, is the identifier that uniquely identifies the specific resource.
- **language**: String, the feedback messages language. Available 'en', 'es'. Fallback to 'en'.

Methods

- **openInsert():** Opens the form or interface for inserting a new item into the CRUD system.
- **editItem(id):** Opens the form or interface to edit the item with the specified `id`.
- **setKeyword(keyword):** Sets the search keyword used to filter the items within the list system based on the provided `keyword`.
- **attachActionId(id):** Adds the specified `id` to the list of IDs selected for batch actions.
- **detachActionId(id):** Removes the specified `id` from the list of IDs selected for batch actions.
- **removeActionItems(idsArray):** Removes the items with the specified IDs in `idsArray` from the CRUD system.
- **refresh():** Refreshes the data or content of the CRUD system, reloading the items from the server.
- **setCustomizationOption(optionName, value):** Dynamically sets a customization option in the CRUD configuration. Receives the option name (e.g., `hideCheckboxSelection`, `disableInsert`) and the value to set.

Events

This component is based on elements such as `dile-crud-list`, `dile-crud-insert`, `dile-crud-update`, `dile-crud-item-delete`, and many others. Therefore, all events documented in those components can be listened to in `dile-crud`. Please refer to the mentioned components for information on those events.

Specific events of `dile-crud`:

- **crud-item-insert:** Dispatched when the system shows the insert form.
- **crud-action-success:** Dispatched when an action succeed. The detail of this event includes the properties `msg` with a message from the server response, `action` with the name of the action being responded to, and `data` with any additional data that the backend may have sent as a response. Of course, the backend should be developed to send all this data.

CRUD component CSS Custom Properties

It is possible to customize the appearance of CRUD components using Custom CSS Properties. This component uses elements such as `dile-button` and `dile-input-search`, and therefore supports the custom CSS properties documented for those components. It also uses CSS custom properties that are consistently applied across the entire component catalog, some of which are detailed on the theming page.

Additionally, there are specific custom properties for `dile-crud`, which are detailed in the following table:

Custom property	Description	Default
<code>--filter-list-margin</code>	Margin of the filter list container	0 0.5rem
<code>--filter-list-gap</code>	Gap between filter list items	0.5rem
<code>--dile-crud-h1-font-size</code>	Font size for h1 headings in CRUD forms	1.5rem
<code>--dile-crud-h1-font-weight</code>	Font weight for h1 headings in CRUD forms	bold
<code>--dile-crud-h1-margin</code>	Margin for h1 headings in CRUD forms	0 0 1rem 0
<code>--dile-crud-insert-button-padding-y</code>	Vertical padding for the insert button	0.4rem
<code>--dile-crud-insert-button-padding-x</code>	Horizontal padding for the insert button	0.5rem
<code>--dile-crud-insert-button-font-size</code>	Font size for the insert button	1rem

Generating CRUD Components for Entities with the CLI

You can use the [Dile Components CLI](#) to create the scaffolding for CRUD components that are already configured for use with `dile-crud`. To do this, run the following command:

```
dile g-crud post/post-crud
```

This command requires that the resource configuration file has been generated previously, which can be done with the CLI command `g-resource-config`. You can find more information on the [resource configuration page](#).

You can get the help with the complete options for this command by running:

```
dile g-crud --help
```

Configuration

Please refer to the [general documentation on the CRUD library](#) to find the established mechanisms for configuring the `dile-crud` component.

belongsTo and relationId configuration

These fields facilitate the implementation of a type of filtering on the items that a `dile-crud` component will allow you to manage. For example, if you are trying to view invoices for the customer with `id=10`, `belongsTo` would be set to "customer" and `relationId` would be set to "10."

This is useful, for example, for managing a specific record on an admin page, like those that can be created using the [dile-crud-single component](#). For instance, when viewing the details of a country, you could use a `dile-crud` component configured with `belongsTo` and `relationId` to manage all the states within that country directly from the `dile-crud-single` component.

Note that these configurations must be supported by the backend. The listing component will handle sending the necessary query strings to the backend, ensuring that the records delivered for the listings in this `dile-crud` component are properly filtered.

Unpaginated Crud Example

For the correct functioning of the `dile-crud` component, a configuration object is required. Depending on the functionalities requested through the configuration object, various additional components from the CRUD library may also be needed.

Configuration object

Find the guides for creating the configuration object on the [resource configuration page](#).

▼ Show Code

Item component

The item component serves as a template to display each of the elements in the list.

▼ Show Code

Resource form component

The resource form provides the necessary fields for adding new elements to the resource. In this example, the same form is used for both insertions and edits, but it is possible to have a different form for each operation.

Instructions on how to create these forms can be found in the [dile-crud-insert](#) and [dile-ajax-form](#) component documentation.
